What is Acute Care Surgery?
Provides care for:
- critically ill/injured patients due to trauma/burn
- patients who need emergent medical attention

What is their scheduling challenge?
Objective: 5 units to be always covered by 15 attendings.
The schedule must consider:
- Personal/professional time-off requests
- Equity
- Spacing balance
- Outside schedules
- Individual rules

How do they schedule currently?
The Division Chief creates the schedule by hand.

What can we help?
Our team has created a tool that automates and optimizes the scheduling process! The tool...
- Applies a mathematical model to enforce scheduling rules and identify the best possible schedule based on chosen criteria
- Generates high quality schedules within seconds
- Reduces the time and work involved with revising the schedule

How does the tool work?
1. Inputs – Gather inputs such as attending’s time-off requests and target number of assignments on each unit
2. Tool generates schedule – Users just need to hit “run”!
3. Attendings provide feedback
4. Inputs revised based on feedback

What are the short-term goals?
- Building many schedules in a short amount of time
- Obtaining rapid feedback and getting a better understanding of trade-offs within schedules.
- Increasing usability of the tool
- Reducing amount of manual work time
- Increasing clarity on schedule preferences

What are the long-term goals?
- Removing the perception of bias in scheduling, ensuring equity
- Equity spanning years with holiday assignments

Process is repeated as many times as necessary to come up with an acceptable schedule.
