How do we evaluate how scheduling policies impact access to care for rural patients with gastroesophageal reflux disease while also considering patient preference for appointment modality?

- Primary vs. specialty healthcare
 - Primary care providers: routine care, maintain health over time
 - Specialists: trained in a particular branch of medicine
- Timely access to care impacts outcomes
- Telehealth has the potential to improve access to care, especially for patients living in rural areas
 - Rural residents tend to be older, poorer, and sicker than urban residents
 - Distance to care is a significant barrier to care

29% of Americans

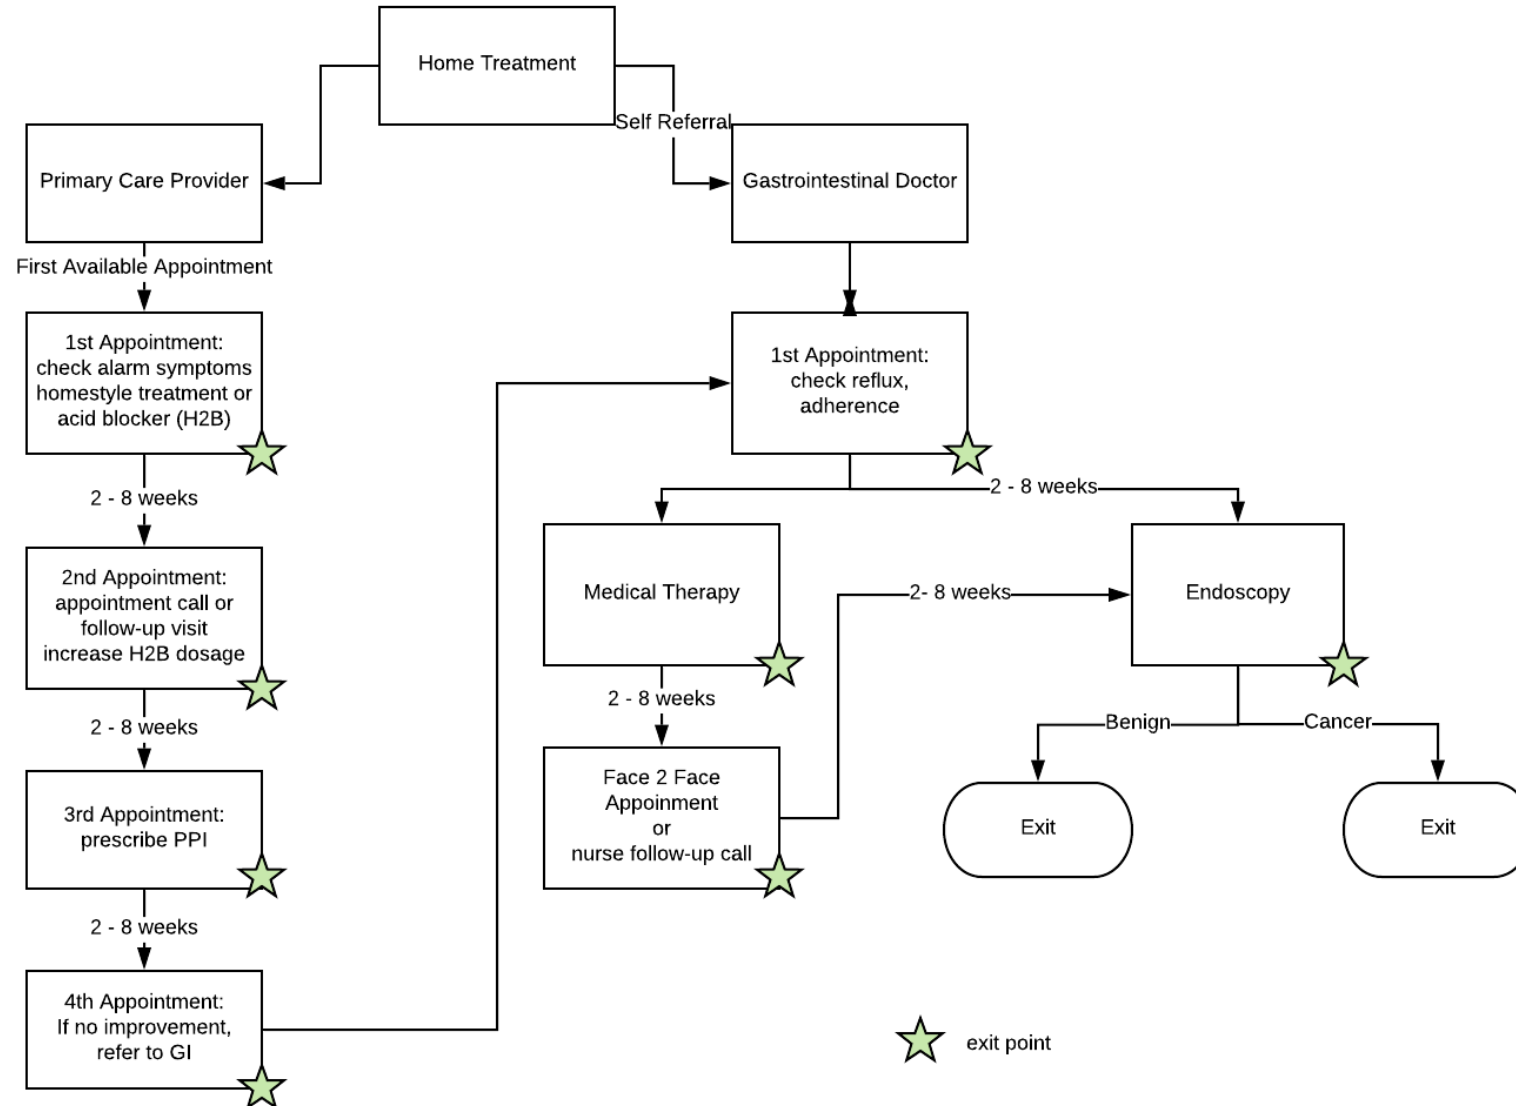

report an unmet health need/delay in

-Negative health outcomes
-Increased cost
-Operational burden

- Patients using VA Medical Center in Ann Arbor, MI
- Currently considering GERD patients
 - Gastroesophageal reflux disease
- Face-to-face versus telehealth
- Simulate patients flowing through our system
 - How do scheduling policies impact patients' ability to get the care they prefer?
 - What policies or system factors impact access?

GERD Patient Flow

- Providers
 - PCPs (2)
 - Capacity: 4 Telehealth, 3 Face-to-Face
 - GI (2)
 - Capacity: 4 Telehealth, 3 Face-to-Face
- Disease diagnoses
 - GERD
 - For those who get endoscopy, probability of benign/healthy diagnosis: 0.90

- Appointment Types
 - Face-to-Face
 - PCP cost: \$100
 - GI cost: \$200
 - Telehealth
 - PCP cost: \$75
 - GI cost: \$150
- Exit probability at each appointment: 0.16
- Endoscopy probability: 0.05

- Patient Arrivals
 - PCP: 5/week
 - Self-Refer to GI: 7/week
- Patient location
 - Probability of “far” patient: 0.014
 - “Far” = more than 40 miles from clinic
- Patient preference
 - Prefer telehealth for “near” patients: 0.5
 - Prefer telehealth for “far” patients: 1.0

- “In-Range” Policies
 - A. First available – any type
 - B. First available – preferred only
 - C. First preferred available. If no preferred, first available of any type
- “Out-of-range” policies
 - 1. First available – any type
 - 2. First available - preferred

- “In-Range” Policies
 - A. First available – any type
 - B. First available – preferred only
 - C. First preferred available.
If no preferred, first available of any type
- “Out-of-range” policies
 1. First available – any type
 2. First available - preferred

Example: Policy C1, patient
prefers telehealth appointments

Patient needs next appointment

Look for next “in-range” (next 2-8 weeks) telehealth appointment

If no in-range telehealth appointments, look for in-range face-to-face appointments

If no in-range appointments, schedule first available out-of-range appointment of any type

- Simulate in C++
 - Unit of time: weeks
 - Simulation length: 52 weeks
 - Replications: 500
- Sensitivity analyses to determine influential inputs

- Total exits (patients “completing” care/leaving system for other reasons)
- Provider utilization
 - Overall, and stratified by face-to-face/telehealth and provider type
- Lead time
- Percentage of appointment preferences met
- Total cost
- Total benign/healthy endoscopy patient and total malignant patients

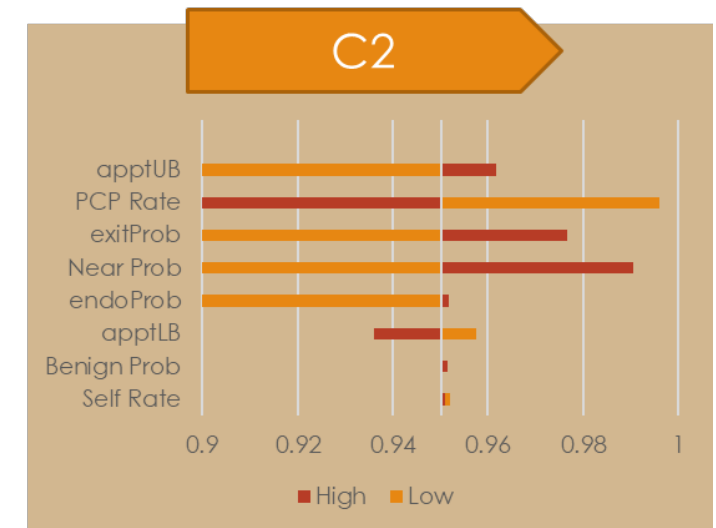

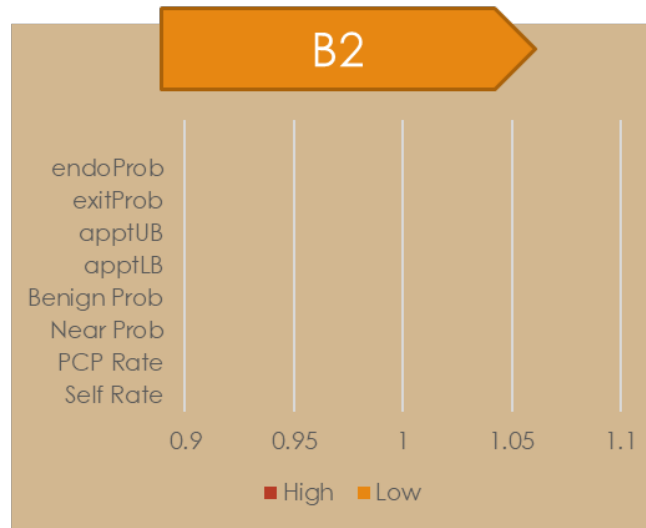

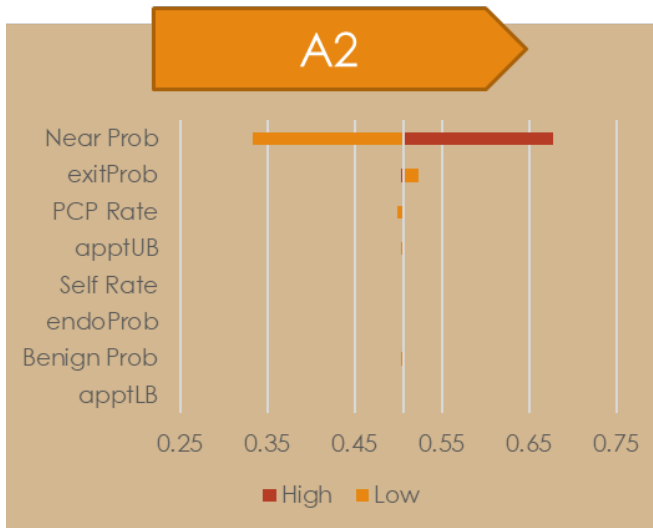

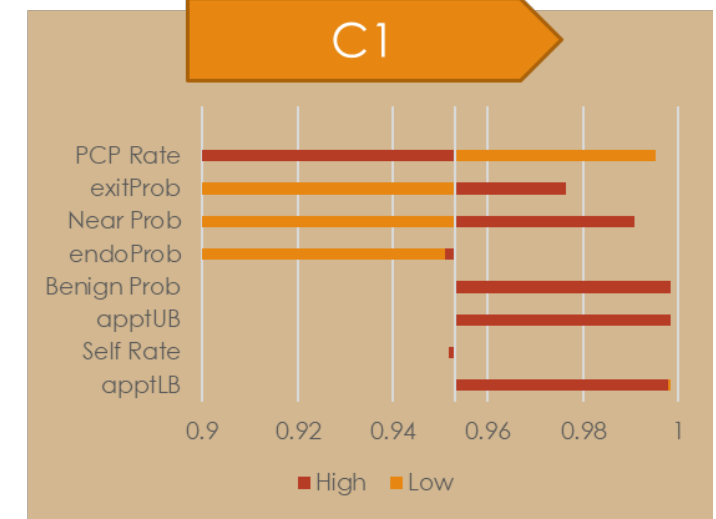

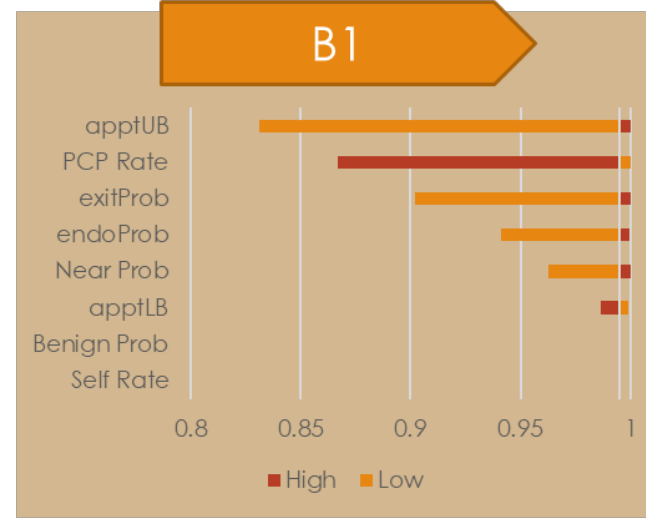

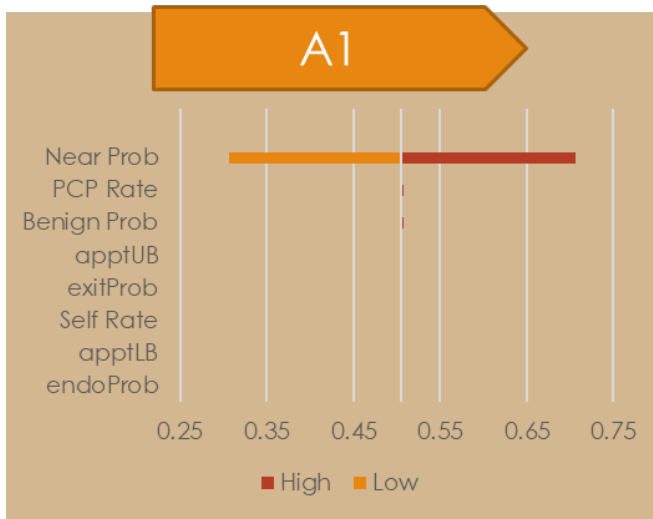

Sample Results

Metric	Mean Result
Patients completing care	365.8
Benign/healthy endoscopies	156.1
Malignant endoscopies	17.3
Overall provider utilization	0.91
Face-to-face utilization	0.95
Telehealth utilization	0.88
Lead time	5.0 weeks
Modality preferences met	50.5%
Total cost	\$172,866

Baseline inputs, Policy A1

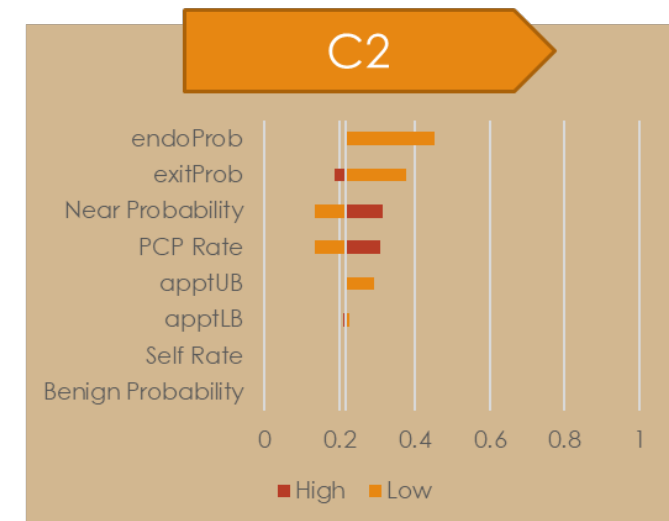

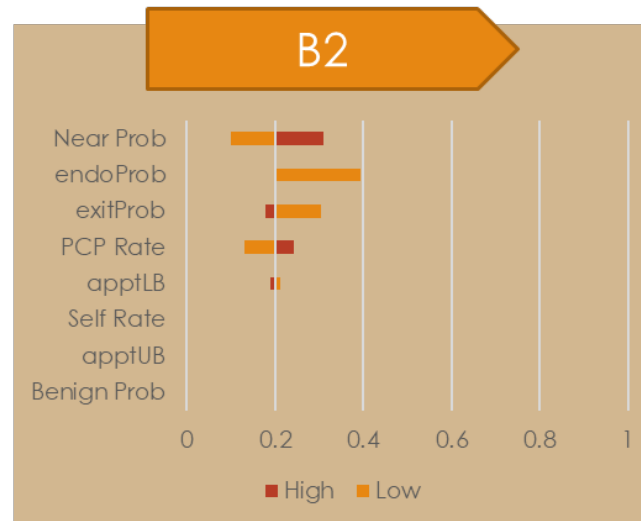

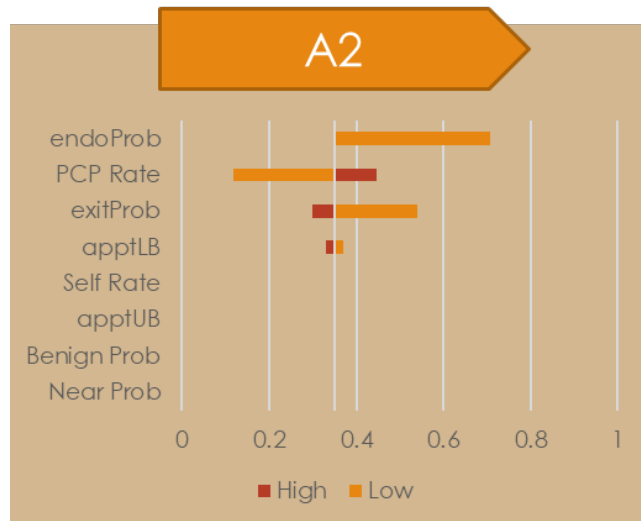

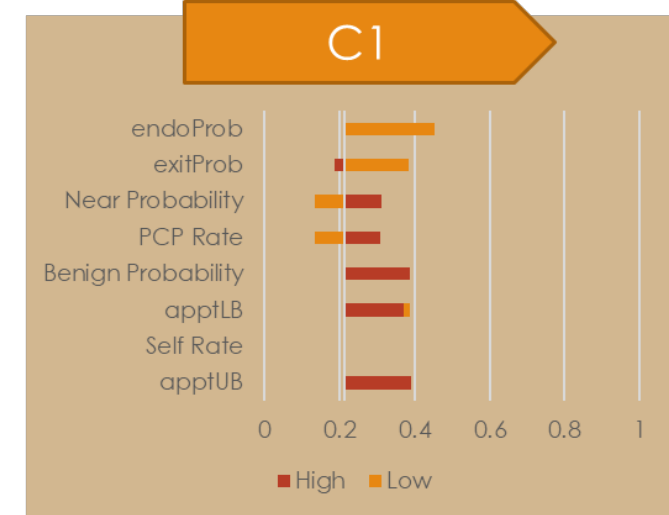

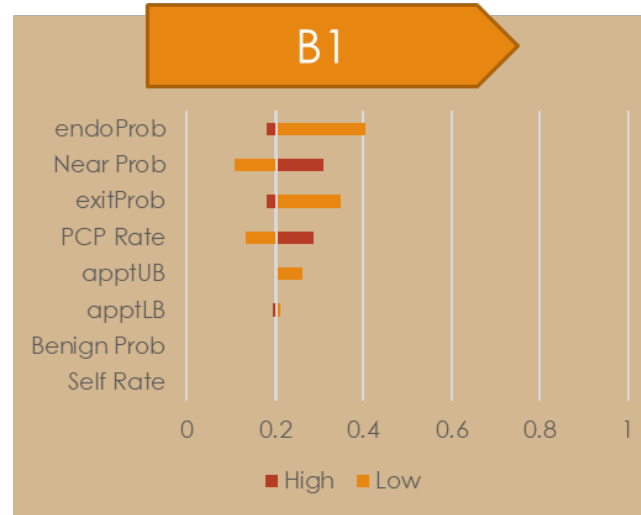

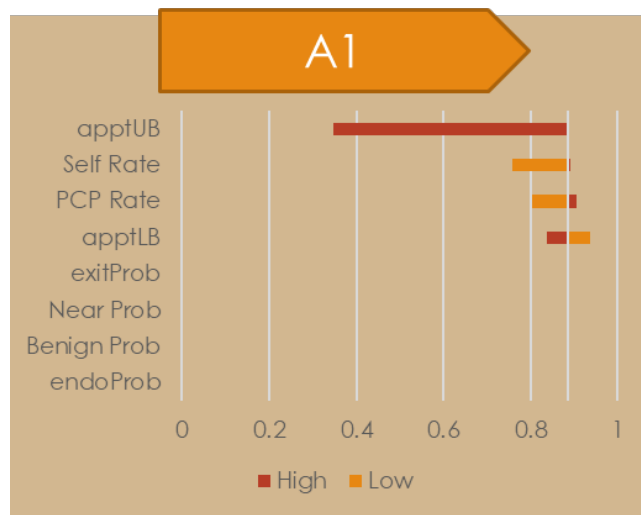

- Inputs changed (one at a time, $\pm 50\%$):
 - PCP_Rate (# of patients/week that arrive to PCP)
 - Example: baseline is 5 patients/week, check 3 and 8 patients/week
 - Self_Rate (# of patients/week that arrive via self-referral)
 - ApptLB/UB(lower bound/upper bound of appointment range)
 - ExitProb (probability a patient will complete care at each appointment)
 - NearProb (probability that a patient will live within 40 miles)
 - BenignProb (probability that patient will receive a benign result from endoscopy)

% Modality Preference Met

- Only Near Probability significantly influenced In-Range Policy A
- Appointment time range upper-bound influenced policies B1 and C2, but not any other scheduling policies
- B2 and B1 had the highest preference on average ($\sim 0.98-1$), while A1 had the lowest preference (~ 0.5)

Telehealth Utilization

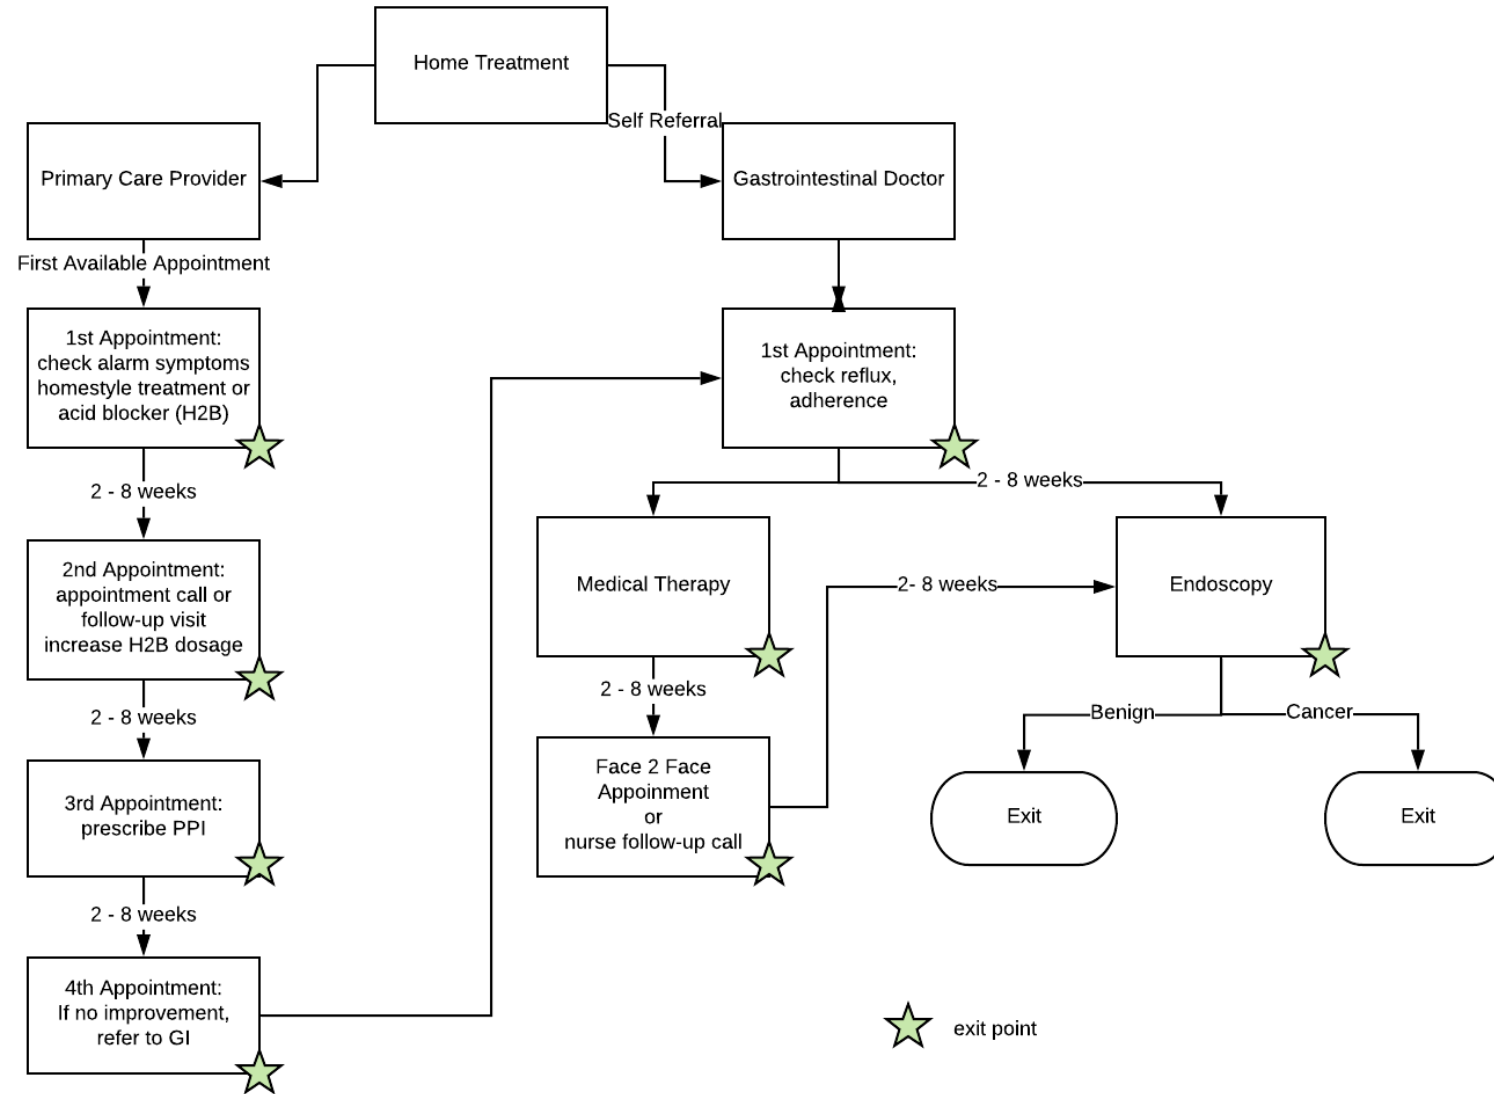

- Appointment upper bound strongly influenced Policy A1
- PCP Rate had significant influence over In Range Policy A
- Telehealth utilization was extremely variable
 - A1 had an average telehealth utilization of 0.9
 - A2 had an average telehealth utilization of 0.35
 - B1, B2, C1, and C2 had an average telehealth utilization of 0.2

Conclusions & next steps

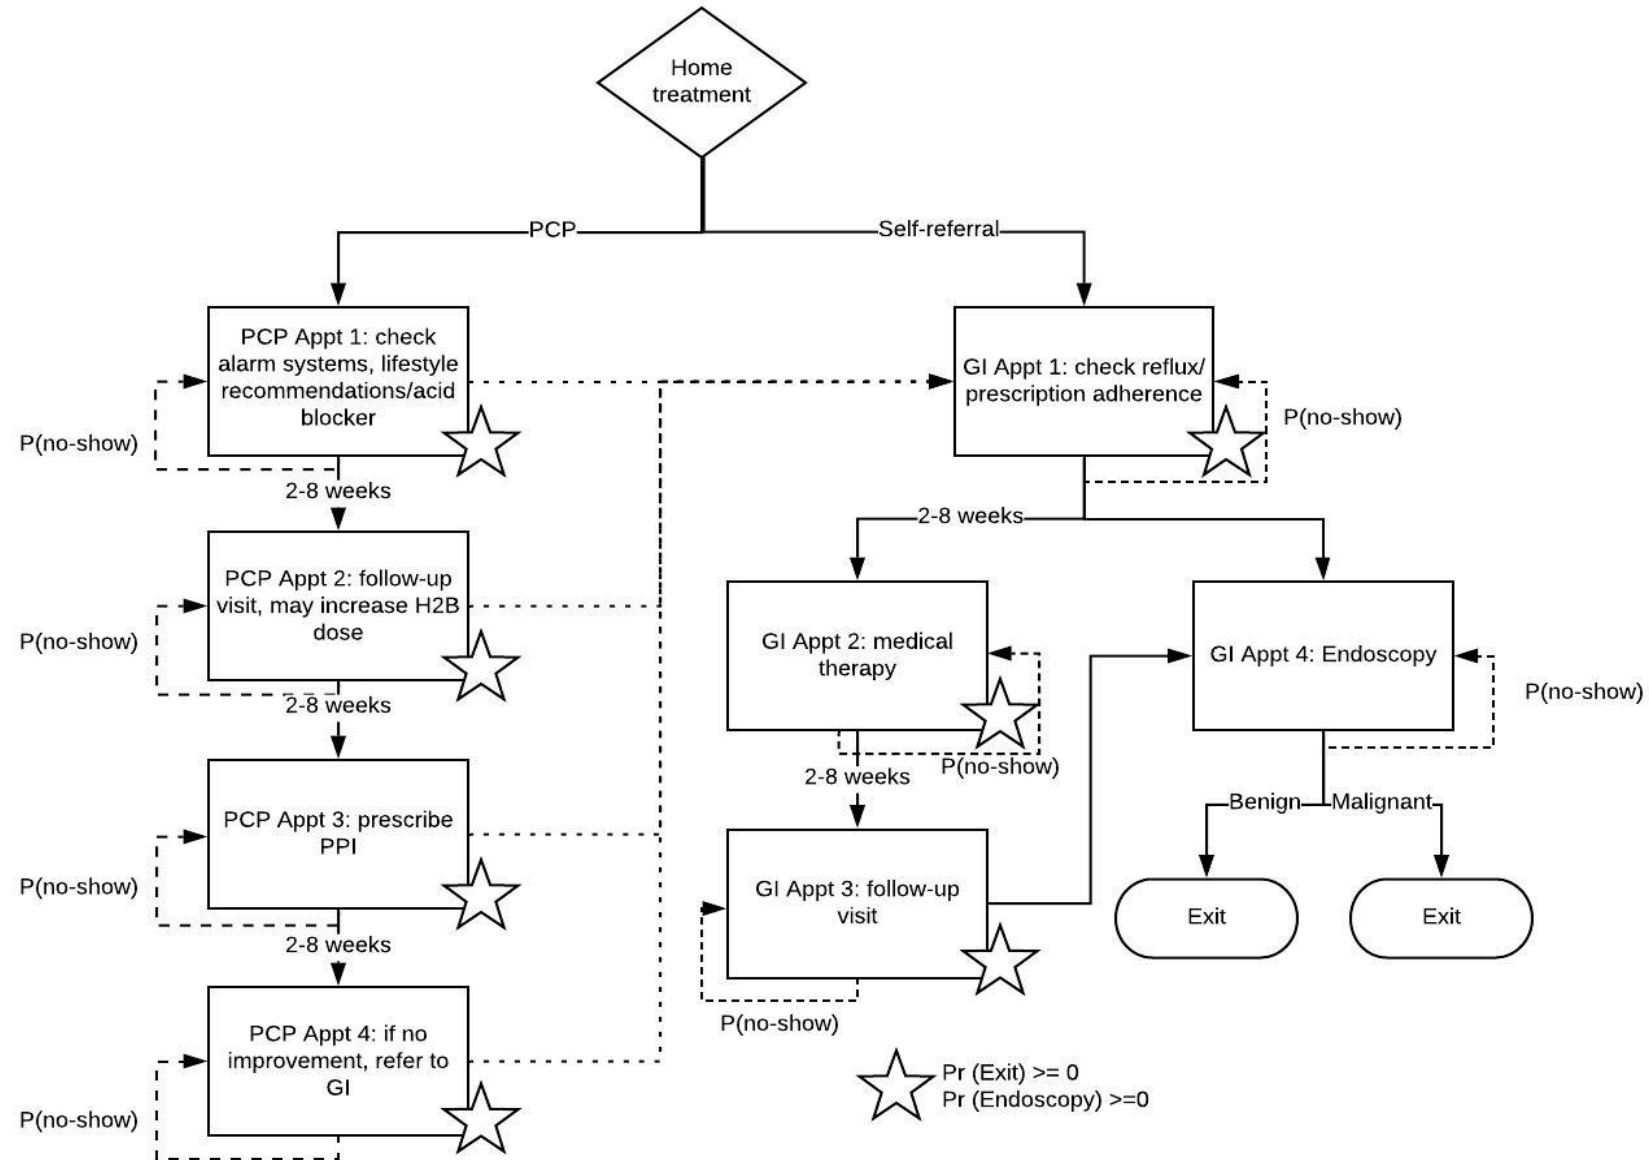

- Telehealth helps reduce barriers to accessing healthcare for rural populations
- Appropriate scheduling policies explicitly allow us to accommodate patient preferences for appointment modalities
- Next steps:
 - Updating patient flow to allow more flexibility between appointments
 - Allowing for patient no-shows and cancellations
 - Expanding patient attributes

Current Patient Flow
